Today: deploy-kit 1.x, in production (spec/v1 chapter 55)
Project CI
validate the Intent; build, pin images
compose
TypeScript compiler renders the estate once
ghcr
one signed artifact per Project, by digest
estate repository
a commit moves the Project's digest pin
Flux, then Flagger
Flux applies; Flagger switches when allowed
Future direction
Project CI
validate, build; watches the rollout
Conductor
compose, dry run, sign; streams events back
self-hosted registry
one signed render per Project and environment
Applier
replaces Flux; pulls, verifies, applies in steps
Flagger
a deployment step driven by the Applier
bi-directional event stream
object status and rollout outcome
