Project CI
validate; build, pin images; ask the service to deploy
Rust compiler
one static binary, run in CI and in the service
Vault Transit
the service's render key, which never leaves Vault
deploy
deploy service, Rust: one binary
compose
every admitted Project, Platform Intent, snapshot
dry run
each changed object, on the API server
sign
the changed render, through Transit
push, move tag
render/<project>:prod, by compare-and-swap
API, OpenAPI 3.1
Vue UI, operators
pause, resume, roll back
Kubernetes cluster
the API server
Flux
pulls the tag, verifies it, applies and prunes
ghcr
one signed render per Project tag
